The job: check every contract for the same clauses

What the postings say

ImmunityBio, contracts paralegal: review contracts for assignment, change of control and other provisions during due diligence.

Cantor Fitzgerald, M&A paralegal: “analyzing vendor/customer contracts for transferability, change of control, and IP ownership issues.”

Andrews Myers, junior associate: conduct legal due diligence and prepare diligence reports.

What it reveals

The same five clause types are searched for in every agreement.

Quotations and page numbers are copied into a table by hand.

An empty search can’t tell “the clause is missing” from “I missed it”.

The right-hand column is our reading of the postings, a hypothesis they do not state.

What we address

A review tool that finds five clause types in a batch of contracts, shows the exact words and the page, and flags what it could not find.

1

Find the clause

Assignment, change of control, termination for convenience, renewal, governing law.

2

Show the exact words

A quotation appears only if it is found word for word in the contract, with its page.

3

Never hide a gap

Every category with no verified finding is labeled “Not found, review required”.

The tool does not interpret clauses. The lawyer still decides what each one means.

Maya’s 30 contracts, before and after

Before

Open each contract and search five clause types by hand.

Copy each quotation and page into a spreadsheet.

Wonder whether an empty search means the clause is absent.

With the tool

Upload all 30 once and read one table.

Check each quotation at its page, then accept it or remove it.

Search by hand only the categories marked “Not found, review required”.

She exports a CSV for her senior lawyer: contract, category, exact quotation, page, review state.

Maya is an illustrative persona. Time saved is untested: the reviewer pilot was not run.

How a contract moves through the tool

1
Ingest
Read PDF or text, page by page

Findings and gaps in SQLite

→

6
Review
Accept or remove, export CSV

The model proposes

Step 3 is the only AI step: one Claude call per chunk returns the category and the exact quotation.

Plain code decides

Code, not the model, checks each quote, labels every gap and keeps the review record.

What we measured, and what we did not

F1 on 102 test contracts

0.69

A keyword-only baseline scores 0.42

Precision and recall

0.65 / 0.74

Our targets were 0.70 and 0.80: not met

Cost of the test run

$8.85

102 contracts in 14 min 40 s

Not proven: time saved. We could not recruit reviewers, so the pilot was not run. Scores use the CUAD labels as published; our check of the answer key came after the test run.

One run on frozen code, scored on the public CUAD dataset (510 contracts, 102 held out for testing).
